                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a new kappa-conotoxin PVIIA which targets potassium channels and can be used to augment neurotransmitter release in pathological situations such as autoimmune disease, e.g. Alzheimer's disease, Lambert-Eaton syndrome or myasthenia gravia. This peptide together with delta-conotoxin PVIIA act synergistically to rapidly kampblize fish which are injected with the two peptides. Injection of kappa-conotoxin PVIIA alone results in different symptoms with an injected fish becoming hyperactive and then contracting and suddenly extending all major fins. This "fine-popping" occurs repeatedly resulting in a series of jerky movements, but injection of only kappa-conotoxin pVIIA does not immobilize or kill the fish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New kappa-conotoxin peptides - which target potassium channels and can be
used to augment neurotransmitter release in e.g. autoimmune diseases.
                                                                                                                                                                                                                                                         /note= "Optionally 4-trans-hydroxyproline, hydroxyproline

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conctoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                               Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; HIIA.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac lembrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; K19A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; R18A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "The C-terminus is either a carboxyl group or an
                                                                                                                                                                                                                          ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, sepecially cardiac ischaemia, cerebral ischaemia, coular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                              Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; K25A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "The C-terminus is either a carboxyl group or an
amide group"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating disorders associated with radical depolarization of excitable
radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

The conducting are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                         Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; R22A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia, and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                            Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; F9Y.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular schaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gape

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and astebma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
           Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; K7A.
                                                                                                                                                                                                                                                                                                                                                                                                                    Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.

                                                                                                                                                                                                                 Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                               invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                           organ protectants. The invertion also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angine, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, escebatal ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                        The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arthythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ecebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present adquence is Comus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protection and preservation of an organ e.g. heart of a mammal comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                         The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arriththmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropsthy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, carebral cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, atthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone smail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                      Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retlinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.

Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury,
organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neptropathy, acute heart failure, peripheral circulation disturbances, hypertension, angine, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, escebal ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                          related conocoxins. The conocoxins can also be used for arresting, protecting and or preserving somatic cells. The invention is for the protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ecrebral ischaemia, coronary artery bypass graft (ABBS) surgery, ischaemic heart disease, aathma and congestive heart failure. The present equence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                          The invention relates to kappa-PVIIA-related conotoxins and their use an organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-

diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasa accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, astham and congestive heart failure. The present sequence is Conus purpurascens (purple cone smail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incortinence, reperfusion injury, peripheres, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ecrebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant, arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to kappa-PVIIA-related conotoxins and their use as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral wasospes accompanying subarachnoid hasmorrhage, arristly disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic, heart disease, asthma, and congestive heart failure. The present cheart disease, asthma, and congestive heart failure. The present

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrivthmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy; nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                           Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Purple cone snail, kappa-PVIIA-related conotoxin, urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant, arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                               organ protectants. The invention also relates to a method of arresting protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral exerbral schaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, and congestive heart failure. The present sequence is Conus purpurascens (purple cone smail) kappa PVIIA analogue
                                                                                                                                                                                                                                                         Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertenaion; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                The invention relates to kappa-PVIIA-related conotoxins and their use

organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                     Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                        invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protection and preservation of an organ e.g. heart of a mammal comprises

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ischaemic heart disease, cerebral ischaemia, anxiety disorder; diabetes, organ protectant, arrhythmia, reperfusion injury; hypertension; angina, retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                       sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, repertusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospassm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure.                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                           The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (GABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to kappa-PVIIA-related conotoxins and their use as

The conocoxins are used for traating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; S17A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-
diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart discase, asthma and congestive heart failure. The preser sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving sometic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                      Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischemic heart disease; cerebral ischemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; andina; retinopathy; coronary artery bypass graft surgery; acute heart failure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a mammal comprises
ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to kappa-PVIIA-related conotoxins and their use
                                                                                                         Gaps

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; V27A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprises

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arriththmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral ecrebral ischaemia, coronary artery bypass graft (CASG) surgery, ischaemic heart disease, asthma, and congestive heart failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             heart of a mammal comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   원
                                                                                                                                                                                                                                                                                                                                                                      The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neptropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral ecebral schaemia, coronary artery bypass graft (CABG) surgery, ischeemic heart disease, asthma and congestive heart failure. Sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, acute heart failure, peripheral circulation disturbance, hypertension, angina, carebral ecrebral schammia, coronary artery bypass graft (CABG) surgery, ischammic heart disease, asthma and congestive heart dialure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aB

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conctoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                         Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Purple cone snail, kappa-PVIIA-related conotoxin, urinary incontinence; ischemic heart disease, cerebral ischaemia, anxiety disorder; diabetes; organ protectant, arrhythmia, reperfusion injury; hypertension, angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, coular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                                                                                                              Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a Karp channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory;

                                                                                                                                                                                                                                                                                                                                                      ö
                                                                             Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving sometic ells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neptropathy, acute heart failure, peripheral circulation disturbance, hypertension, angina, cerebral ecrebral schemmia, coronary artery bypass graft (ARG) surgery, ischammia, coronary artery bypass graft (ARG) surgery, ischammia, coronary artery bypass graft (ARG) surgery, ischammia, coronary artery bypass graft (ARG) surgery, eschammia, coronary artery bypass graft (ARG) surgery, ischammia, coronary artery bypass graft (ARG) surgery,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; N24A.
Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                         related concoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                  The invention relates to kappa-PVIIA-related conotoxins and their use a organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "The C-terminus is either a carboxyl group or an

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conctoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-

Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA, peptide

Claim 1; Page 28; 46pp; English

```
ö
              The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                  Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; D13A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-

The conotoxins are used for treating disorders associated with cradical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Purple cone snall, kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; N21A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /notes "The C-terminus is either a carboxyl group or an

The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, utinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbanes, hypertension, angina, cerebral cerebral ischaemia, coronary artery bypass graft (GABG) surgery, ischaemic heart disease, aschma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                          Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, utinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, incontinence, reperfusion injury, peripheral circulation disturbances, hypertension, angina, cerebral echaemia, coronary artery bypass graft (CABG) surgery, ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                      Conus
 The invention relates to kappa-PVIIA-related conotoxins and their use as protectings. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation discurbances, hyperension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                  Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Mcintosh JM;
                                                                        Conus purpurascens kappa-PVIIA analogue peptide, D13A.

                organ protectants. The invertion also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, escebati ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, aethma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     snail; kappa-PVIIA-related conotoxin; urinary incontinence;
The invention relates to kappa-PVIIA-related conotoxins and their use
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral cerebral isohaemia, coronary artery bypass graft (CABG) surgery, ischaemia cononary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                               Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVXIA-binding site.
retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The sequences given in AAR39608-30 are omega conopeptides (OCTS) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTS inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT WVIIA binding sites present in neuronal tissue. OCTs are components of peptide toxins derived from marine snails of the genus Conus, and act as calcium channel blockers. These OCTs may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. peptides from Conus sp. (cone snais). The peptides and their analogues are used as analgesics acting by blocking N-type voltage-sensitive are used as analgesics acting by blocking N-type voltage-sensitive calcium channels. The Ocs can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone degenerative diseases, AIDS, reflex sympatheric dystrophy, herpes coster neuropathy, diabetic neuropathy administered in a medicament via an hyperalgesia. The OCs are preferably administered in a medicament via an chyperalgesia. The OCs are preferably administered epidurally in the absence of a permeation enhancer, at doses that are comparable to effective analgesic doses using intrathecal administration. OC formulations comparising an OC and a carboxylic administration. OC They also confer stability to solutions containing them for prolonged
                                                                                                                                                                                                                                                                        Stable omega conopeptide compositions - for producing analgesia and for inhibiting progression of neuropathic pain disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Omega conopeptide, analgesic, treatment, neuropathic pain; inhibition, neuronal damage; schizophrenia; tardive dyskinesia; analgesia; acute dystonic reactions; inflammation; epilepsy.

                                                                                                                                                                                                                                                                                                                                                                                                                                      The C-terminal is amidated. Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24 hr after onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (OCT) WIIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the WIIA site to that for the WIIC site. (I) is one of the OCTS WIIA, GVIA, GVIA or RVIA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare USSOS403 where cpds. are given within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage is achieved. (I) is admin. e.g. by intracerebroventricular (ICV) infection at 0.1-20 microg/kg, but can also be given i.v. (opt. after treatment with antihisteramines to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for (1) selective inhibition of N-type voltage-gated Ca currents in neuronal tissue and (2) selective inhibition of N-channel mediated neurotransmitter release in neuronal tissue. Primary sequences of omegaconopeptides are given in harm 152. Several analog omega-conopeptides are given in ARR17762-6. (Updated on 25-MAR-2003 to correct PN field.)

```

A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat

inflammation and associated pain. The treatment can also be used to produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents an analogue omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. (Updated on 27-AUG-2003

Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig ileum and (b) selectively binding to omega conopeptide MVIIA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conotoxins MVIIA and TVIA. The method is used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Omega-conopeptide; peptide toxin; snail; calcium channel blocker; analgesia; guinea pig ileum; omega-conotoxin; pain; neuropathic.

The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia caused by selected compounds are capable of pain. Analgesia caused by selected compounds may reduce the reliance on opioid analgesia caused by selected compounds may reduce the reliance on opioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention

Omega-conopeptides are components of peptide toxins produced marine snails of the genus forous. Omega-conopeptides and their derivatives act as calcium channel blockers and may be useful for producing analoguia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norephine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardiave dyskinesia and acute dystonic reactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.

The present sequence represents an omega-conopeptide analogue. Omega-conopeptides are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the analgesic effect produced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to inhibit electrically stimulated contraction of the guinea pig ileum and bind to omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing neuronal damage related to an ischemic condition in mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                         /note= "amidated residue"

```
The invention relates to isolated omega-conopeptides, nucleic acid
sequences encoding them, and propeptide sequences. The activity of the
peptides of the invention may be described as, analgesic, anticonvulsant,
vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular,
antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary,
antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act
by modulating the activity of voltage gated ion channels. They may be
used for treating or preventing disorders associated with voltage gated
ion channels such as neurological disorders, e.g. seizure (associated
with epilepsy), neurotoxic injury associated with conditions of hypoxia,
anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
conditions of migraine; inflammation or cardiovascular disorders
They may also be used for treating psychiatric disorders e.g. psychosis,
anxiety or schizophrenia. The analgesic agents of the invention show
diminished side effects and toxicity, and are non-addictive. The
sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                 New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                            Shon K;
                                                                                                                                                      Mcintosh JM, Watkins M, Garrett JE, Jones RM, Cartier GE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1(a); Page 72; 195pp; English.

```
The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebropotective, cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal coverts; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB95695-ABB96697 represent omega-conopeptide propertide sequences

These OCT8 inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in neuronal tissue. OCT8-are components of peptide toxins derived from marine snalls of the genus Conus, and act as calcium channel blockers. These OCT8 may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. AAW19544-W19553 are naturally occurring omega conopeptides (OCS) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analogasics acting by blocking N-type voltage-sensitive calcium channels. The OCS can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone of degenerative diseases. AIDS. reflex sympathetic dystrophy, herpes zoster neuropathy, diabetic neuropathy, hyperesthesia, allodynia or hyperalgesia. The OCS are preferably administered in a medicament via an cypianis route in a continuous influsion or sustained release formulation. The OCS can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to conference of a permeation of and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged concern methods and long-term storage. (Updated on 27-NUG-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24

In after onset of ischaemia, of a cpd. (1) which binds selectively to an omega-conotoxin (OCT) WIISA site in neuronal fissue. (1) has selectivity at least 100 expressed as ratio of binding affinity for the MVIIA site to the MVIIA site in the CCT MVIIA site in the OCTS MVIIA, MVIIB, GVIIA, GVIIA, OR TANA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare US5051403 where opds. are given within 1 hr of the onset of ischaemia) a contracerebroventricular (ICV) injection at 0.1-20 microg/Ks, but can also be given i.v. (opt. after treatment with antihistamines to minimise redn. In blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins for (1) selective inhibition of N-Farnary caused and conopeptides are given in haRR37752-62. Several analog omega-conopeptides are given in AAR37752-62. Several analog correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                          The present peptide is an omega conopeptide, useful as an analgesic, especially for treating neuropathic pain. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site, and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat inflammation and associated pain. The treatment can also be used to produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conue, and which act as calcium channel blockers. (Updated on 27-AUG-2001 to correct OS
                                                                                                                                                                                                                                                                                                                                                                      Treatment of inflammation, comprises administration of omega-conopeptide - effective to block voltage-gated calcium channels, bind with high affinity to omega-conopeptide binding site, and inhibit neuro-transmitter release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia caused by selected compounds may reduce the reliance on opioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Marine snail; omega-conopeptide; calcium channel blocker; SVIB; SNX-183; toxin; analgesic; antilnilammatory; anticonvulsant; neuroleptic; norepinephrine release inhibitor; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation; epilepsy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                     Sequences AAW95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig ileum and (b) selectrically inding to omega conopeptide WIIA binding sites in neuronal tissue, where these activities are within used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neuropathic; pain; conotoxin;

                                                                                      The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (III) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptide s.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
     S
of test compound in blocking voltage-gated calcium channels, binding omega conopeptide binding site and inhibiting norepinephrine release.
                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an omega-conopeptide. Omega-conopeptides
vivo for the treatment of various disorders. Endogenous therapeutic peptides are not sultable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                         ö

Omega-conopeptide S6.2 generic toxin sequence.

(first entry)

12-JUL-2002

ABB96786;

ABB96786 standard; peptide; 26 AA.

```
are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the analgesic effect produced by an optate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to inhibit electrically stimulated contraction of the guinea pig ileum and bind to omega-conopeptide MVIIA binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing neuronal damage related to an ischemic condition in memmals, and in treating schizophrenia, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises peptides having calcium channel blocking activities which are derived from the venomous saliva of assassin bugs. The calcium channel blocking peptides of the invention are useful for treating stenocardia, hypertension, myocarditis, arrhythmia and cerebral ischaemia. The present amino acid sequence represents a cone snail wconotoxin peptide

peptices of the invention may be described as a malegest, anticonviolant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antiinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, on inspectoric, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. saizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show analysis and effects and toxicity, and are non-addictive. The sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                   /label= OTHER / 1251-Tyr, mono-iodo-Tyr or di-iodo-Tyr or O-iodo-Tyr or O-sulpho-Tyr or O-Phospho-Tyr"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for detecting or measuring the form of Motch that mediates Norch signal transduction in a sample of cells. The method involves detecting or measuring the expression of a Notch heterodimer containing reducing agent-sensitive linkage in the cells and comparing detected or measured expression to the detected or measured expression of full-length Notch in the cells. The present sequence is Xenopus Notch/Xotch (XenN) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated with epilepsy), neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic

events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96698-A3B96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of omega-cono-peptide(s) which selectively inhibit voltage-gated calcium channels - to induce analgesia, enhance opiate analgesics, treat

The sequences given in AAR39608-30 are omega conopeptides (OCTS) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTs inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in neuronal tissue. OCTs are components of peptide toxins derived from marine snails of the genus Conus, and act as calcium channel blockers. These OCTs may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. (I) which binds selectively to an onega-conotoxin (OCT) MVIIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the MVIIA site to that for the MVIIA site. (I) is one of the OCTS MVIIA, MVIIB, GVIA, GVIIA or RVIA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal cansed by stroke. By delaying admin. for some time (compare C USSO51403 where cpds. are given within 1 hr of the onset of ischaemia) a creater redn. in neuronal damage is achieved. (I) is admin. e.g. by compare compare compare compare compared in reacrebroventricular (ICV) injection at 0.1-20 microg/Kg, but can also compared in the compared compared in neuronal damage is achieved. (I) is admin. e.g. by compared to optimize a compared compared in holood pressure caused by (II). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-type voltage. C dard currents in neuronal tissue and (2) selective inhibition of N-type voltage. C channel mediated neurotransmitter release in neuronal tissue. Primary compared by film of N-RN37752-62. Several analog compared by the compared on ARR37752-62. Several analog compared by the compared on ARR37753-76. (Updated on 25-MAR-2003 to

rechaemia-related neuronal damage in manmals is reduced by admin., 4-24

hr after onset of ischaemia, of a cpd. (I) which binds selectively to an onega-conocton (OCT) WVITA site in neuronal tissue. (I) has selectivity

c mega-conocton (OCT) WVITA site in neuronal tissue. (I) has selectivity

c that for the WVIIC site. (I) is one of the OCTS MVIIA, MVIIB, GVIA, GVIIA

or RVAR or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal

damage caused by stroke. By delaying admin. for some time (compare

US5051403 where cpds. are given within 1 hr of the onset of ischaemia) a

c greater redn. in neuronal damage is achieved. (I) is admin. e.g. by

intracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also

be given i.v. (opt. after treatment with antihistamines to minimise redn.

in blood pressure caused by (I)). (I) is also at least as effective as

the specified conocoxins for (I) selective inhibition of N-type voltage-

gated Ca currents in neuronal tissue and (2) selective inhibition of N-

channel mediated neurotransmitter release in neuronal tissue. Primary

sequences of omega-conopeptides are given in AAR37752-62. Several analog

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAM19544-W19553 are naturally occurring omega conopeptides (OCS) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analgesics acting by blocking N-rype voltage-sensitive calcium channels. The OCs can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone curropathy, diabetic neuropathy, hyperesthesia, allodynia or neuropathy, diabetic neuropathy, hyperesthesia, allodynia or hyperalgesia. The OCs are preferably administered in a medicament via an optimuous infusion or sustained release formulation. The OCs can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to effective analgesic doses using intrathecal administration. OC effective analgesic doses using intrathecal administration. OC commulations comprising an OC and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged created and peace of a permeation that are considered to a containing them for prolonged created and peace of a permeation that are considered to a containing them for prolonged created and peace of a permeation that are considered to a containing them for prolonged created and an analyses of treatment metcheds and long-term storage. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. In a rat paw formalin test, the peptide had an EDSO of greater than 1.0 microg in phase 1, and greater than 1.0 microg in phase 1, and greater than 1.0 microg in phase 2 (by intrathecal administration). (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                         Omega conopeptide; analgesic; treatment; neuropathic pain; inhibition; neuronal damage; schizophrenia; tardive dyskinesia; analgesia; acute dystonic reactions; inflammation; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                              A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treatmention and associated pain. The treatment can also be used to produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conus, and which act as calcium channel blockers. (Updated on 27-AUG-2001 to correct OS
